

Graph Creation and Data Sources

In my report, there are two key graphs that were created to visualize the findings of the study:

- 1. Graph 1: Impact of Dust and Shading on Solar Panel Efficiency**
- 2. Graph 2: Proposed Strategies for Efficiency Improvement**

Both of these graphs were generated using the online tool available at RapidTables (<https://www.rapidtables.com/tools/line-graph.html>). This tool was instrumental in accurately depicting the trends and relationships within the data collected.

The data used to create these graphs was obtained directly from participants during the interviews conducted as part of the study. Participants provided valuable insights into the factors affecting solar panel efficiency and proposed strategies for improvement. This data was meticulously recorded, analyzed, and then represented visually through the above-mentioned graphs to facilitate a clearer understanding of the study's findings.

By leveraging the RapidTables Line Graph Tool, the data was transformed into clear and concise visual representations, allowing for a more effective communication of the results.
